

Industrial Engravers Australia Pty Ltd.

Stainless Steel

We specialise in engraving stainless steel

There are different types of stainless for engraving such as 304, 316 and 445m2.

316 and 445m2 are more suited for areas closer to the coastline. These materials typically come in brushed and satin finish.

Aluminium

Aluminium comes in various thickness from 0.6mm to any thickness available. With aluminium we can supply it in various annodised colours as well as with a brushed or satin finish.

The engraved sections can be paint filled with colours of your choice.

Annodising is a coating suited for outdoors. If you would like multi colours on a plate just ask and we are happy to paint fill the desired areas.

Below are samples of our anodised aluminium.

They are the surface colours, which can be paint filled with any desired colour you like, or even multiple colours.

Especially great for company logos with various colours.

Brass

We can supply Brass in various thicknesses and finishes, such as lished (brushed) polished and satin.
